The carbon monitoring and reporting tool

Carbon-constrained economy

In Europe, policies are moving towards a carbon-constrained economy. Since 1 January 2005 the European Emission Trading Scheme has come into force. Under this scheme, companies are obliged to monitor and report their carbon emissions to the relevant authorities. At the same time, they need to know what their current position is in order to make sound decisions. Ecofys has developed CarMon™, a monitoring and reporting tool that will help you fulfill your legal obligations, provide monitoring management information and facilitate decision-making on all levels within your organisation.

Software module for emission monitoring and reporting

What is CarMon™?

CarMon™ is a software module that is designed to fulfill your monitoring and reporting obligations as laid out in the EU and national monitoring guidelines. The software module consists of a web-based database in which relevant installations, metering devices -including their accuracy-, monthly CO₂ emission data (activity data) and associated tiers are stored.

Reporting on different levels for multiple-site organisations

With this data CarMon™ generates the required emission monitoring report. Because the software generates automated emission reports, verification can be done at lower costs. In addition, the module provides monthly management information about the company's position, making it easy for executives to decide whether to take on-site reduction measures, buy CO₂ credits or sell superfluous credits. The software is designed to aggregate and report emission information on different levels, thus facilitating monitoring and managing emissions for multiple site organisations.

User friendly and web-based interface

Why Use CarMon™?

The emission market, including its regulations, is a dynamic one. Production volumes can change dramatically over a year. CarMon™ allows you to easily assess your carbon position on a regular basis. Its user-friendly and web-based interface makes the management information it generates available anytime and anywhere you like. With this unique and powerful feature the tool is suitable for the expert's desktop as well as during boardroom discussions.

Access anytime, anywhere
